

GEOMETRICAL MECHANICS

Part II

Lectures by Saunders MacLane

Department of Mathematics
The University of Chicago

Spring Quarter 1968

These Lecture Notes were prepared with assistance
by a grant from the Office of Naval Research

© 1968 by Saunders MacLane

All rights reserved

With a guest lecture by René Thom, a chapter by David Golber
and supplementary material by Raphael Zahler

Notes by: George Angwin
David Golber
Reinhard Schultz
Martha Smith
Stanley Weiss
Raphael Zahler

TABLE OF CONTENTS

INTRODUCTION TO PART II	iii
CHAPTER IV. MANIFOLDS	1
29. Topological Spaces	1
30. Manifolds	6
31. The Tangent Bundle	13
32. Bump Functions and the Extension of Germs	15
33. Volumes on Symplectic and Contact Manifolds	17
34. Poisson Brackets	20
35. Submanifolds and Immersions	28
36. Invariants on a Symplectic Manifold	31
37. Submanifolds of Constant Energy	34
CHAPTER V. QUALITATIVE PROPERTIES OF VECTOR FIELDS	39
38. Orbits	39
Structural Stability; Lectures by René Thom :	45
39. Gradient Vector Fields	47
40. Qualitative Dynamics	48
41. Morse Theory	57
42. Critical Points in the Degenerate Situation	62
CHAPTER VI FIRST ORDER PARTIAL DIFFERENTIAL EQUATIONS.	65
43. The Hamilton-Jacobi Equations	65
44. Transformation to Equilibrium	68
45. Characteristics	71
46. The General First Order P.D.E.	76
47. Contact Manifolds	81

CHAPTER VII. COVARIANT DIFFERENTIATION	88
(By David Golber)	
48. Riemannian and Pseudo-Riemannian Metrics	88
A. Definition; B. Local Expression.	88
C. How to Construct Riemannian Metrics	89
49. Covariant Differentiation	90
A. Motivation.	90
B. The Abstract Covariant Derivative.	90
C. Covariant Derivatives of a Vector Field Along a Curve.	93
D. Parallel Translation	94
50. Nice Covariant Derivatives	96
A. Torsion	96
B. Invariance of g under Parallel Translation.	98
C. Example.	101
51. Lagrange's Equation	102
SUPPLEMENT: EULER'S EQUATIONS	107
(By Raphael Zahler)
